Claim 1

Paragraph [0040] and Fig. 3 of document 1 [JP, 8-136810, A (HAMAMATSU PHOTONICS K.K.), 31 May 1996 (31.05.96)] cited in the ISR pertains to a disklike member 360 that converges illumination light at respective different locations in the optical axis direction; the disklike member consists of fan-shaped portions with different thicknesses respectively.

The applicant, in the written reply, compares the present invention to the invention described in the aforesaid claim 1 and asserts the point that the phase change means and the confocal point scanner are separately and independently provided. But the point about independently and separately is not reflected in the claim, so this assertion cannot be employed.

Therefore the present invention is not novel and does not involve an inventive step on account of the aforesaid document 1.

Claims 2-7

The present invention is an invention related to a multilayer observation optical microscope, and provides a phase change means and a confocal point scanner independently and separately, and thereby achieves the advantageous effect over prior art of being able to completely divide observed images of different depths.

Therefore the present invention is not obvious on the basis of any of the documents cited in the ISR.
